

# Animals 5

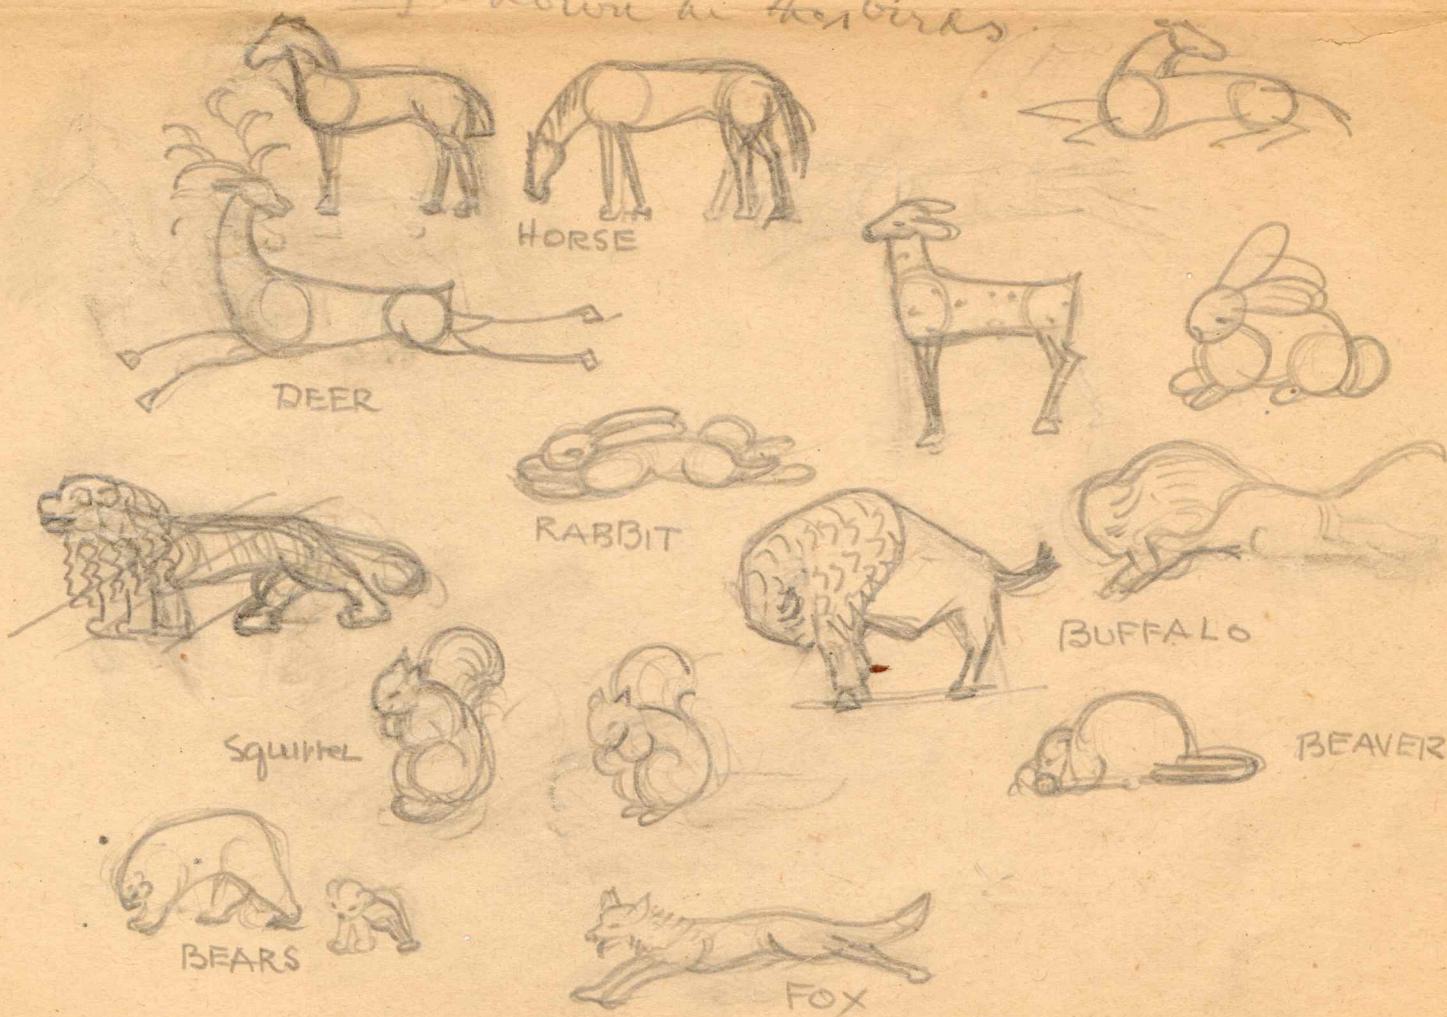

3.37

As the study of Design develops, we realize that it leads into every field of interest - we have found that by reducing any form to its simplest elements, the charm & the individuality of that form may be interpreted.

Take for instance Animals. All quadruped animal forms may be reduced in the beginning to one basic structure. It consists of two circles. Join these circles with two lines, as shown.

The position & movement of the animal depend on the placing of the neck, head, legs & tail, as already shown in the works.

Note how the same structure serves for widely different kinds of animals.
